## Digital Retinal Photography

---

The health of your eyes is important to us and make no mistake, it can start to deteriorate well before you notice a change in your vision. This is where Digital Retinal Photography comes in

At Pabari opticians we are now able to offer digital retinal photography. We feel this is the most of effective way of recording the appearance of the back of your eye. During an eye examination, our optometrists routinely study the back of your eye, looking for any signs of abnormality. With the digital imaging we are now able to study your eyes in more detail. The image is displayed on a computer screen and then stored, by doing this we are able to compare images, year on year, which is extremely useful.

We now offer the retinal photography as part of our eye exam for a small additional charge. This procedure can be done at the same time as the eye exam, and we will be more than happy to explain it further or answer any questions that you may have. It may be necessary to dilate your pupils if they are not big enough for the image to be taken. We can let you know if this will be required at this at time of the test.
